## ABSTRACT

A process for preparing free-flowing, phasestabilized ammonium nitrate comprises the following steps.
A solution of ammonium nitrate (12), a surfactant (13), a

5 phase stabilizer (26), and an inert liquid (20) is
prepared. The solution is atomized to form a stream of
droplets. The droplets are freeze-dried to form
agglomerates (54) of crystals of phase stabilized ammonium
nitrate. The crystals of phase stabilized ammonium

10 nitrate in the agglomerates are coated with a film
comprising the surfactant. The agglomerates are
disintegrated into separated free-flowing phase stabilized
ammonium nitrate in the agglomerates crystals coated with
a film comprising the surfactant.
